ASCEND – Advanced Support for Career Exploration and Navigating Directions (SIH1666)

TL: Gavini Lalitha Sri (4243) Batch: CSM-A:06 Guide Name: - Dr. V Muralidhar

TM1: Bhargava Durga Prasad Gajula (4213)

TM2: Bondili Likith Kiran Singh (4220)

TM3: J L S Ajith Vardhan (4254)

DataBase Design

Determine the purpose:

The purpose of a Ascend project in database design is to create a structured system for storing and managing information about various career paths, skills, and related educational requirements, allowing users to easily search, filter, and analyze data to make informed career decisions; essentially acting as a personalized tool to help individuals explore potential careers based on their interests, skills, and background, often utilizing features like matching algorithms to suggest suitable career options.

Organize information:

To organize information for a career guidance project on database design, structure your data around key aspects like: career paths, required skills, educational pathways, industry applications, emerging trends, and potential job titles.

Create tables:

- Users: Stores information about users who access the platform, including their personal details, login credentials, and career interests.
- Careers: Contains information about various career paths, their requirements, and growth potential. Helps users explore and evaluate career options.
- Using the View for Authentication
  When a user attempts to log in, the system can query this view to validate their credentials

Columns for Tables:

Users

- **First_Name**
- **Last_Name**
- **Email**
- **Password**
- **Confirm_Password**

Career

- **Industry_Type**
- **Department**
- **Role_Category**
- **Key_Skills**
- **Role**

View

- **Email**
- **Password**
